

## Hazardous Chemical Risk And Safety

In the past, chemical labeling was considered a complicated and difficult task, especially when localized Risk and Safety phrases were involved. EASYLABEL<sup>®</sup> 5 provides you with tools that will help you to design even the most complicated chemical labels with confidence.

- EASYLABEL 5 ships with an example label format, an example chemical database and a Risk and Safety Phrase database (phrases are in English, Danish, Dutch, German, Greek, Finnish, French, Italian, Portuguese, Spanish and Swedish) to get you started.
- Sometimes it is necessary to not only import data from one database but from a second or multiple databases. With EASYLABEL 5 it is possible to create and use a *Database Cross Reference* to accomplish this. A Database Cross Reference is a special text string that can reside in any database system. The Database Cross Reference acts as a pointer that directs EASYLABEL to the database where the data is stored. This is very useful for selecting all of the necessary Risk and Safety phrases for a given chemical in the required language.
- A new field type called *Block Text* has been added to EASYLABEL 5. Block Text is similar to a paragraph field but the contents of the field may come from more than one source of data. Separators can be inserted between each of the sources of data to form a list if desired. A Block Text field would be the ideal place to receive the localized Risk and Safety phrases.
