EASYLABEL Replace Files

A Replace File is an ASCII Text file that can be used to temporarily replace field data on a label format that has been downloaded to the memory of a printer. EASYLABEL supports the creation of Replace Files for cab Apollo, A Series, M Series, and Mach Series printers and on Tharo H and V Series printers.

The advantage of a Replace File is that it precludes the necessity of understanding the command language of the target printer.

The creation of a Replace File is as simple as setting the Replace File option in the label format specifications to YES. When the label format is sent to the printer memory, the Replace File is automatically created and placed in the same directory as the label format.

The Replace File template can be uploaded to most any type of system. It can be easily edited to include your variables and sent to a printer to populate and print previously downloaded printer resident formats.
